

What is MirrorCloud?

MirrorCloud is a business continuity add-on to the SmartStyle platform for Windows servers and desktops. It provides block level, continuous data mirroring from a physical or virtual machine to a SmartStyle environment. Should a disaster or hardware failure occur, a desktop or server being mirrored to SmartStyle can be virtualized in a matter of minutes.

MirrorCloud is built on the scalable SmartStyle Computing platform. This allows you to add resources as needed for increased storage demands or virtualizing additional machines. MirrorCloud utilizes solid state disks combined with its underlying BitSpread storage to deliver a high performance, highly available business continuity solution.

- A Complete Hardware and Software Solution
- Scalable Infrastructure
- Business Continuity for Servers and Desktops
- Offsite for Disaster Recovery
- Easily Transitions into a Private Cloud
- Continuous Data Mirroring
- File and Folder Level Recovery
- Failover Virtualization
- Live Bare Metal Recovery
- Granular Exchange Recovery

Scalability

SmartStyle environments running the MirrorCloud add-on can expand as required by simply adding in additional cloud servers. Each cloud server is a 2U rack mount. By providing on-demand scalability, MirrorCloud reduces upfront investment costs.

Performance

MirrorCloud combines solid state drives (SSD) for caching with underlying SATA II hard drives for storage to deliver three to four times the performance of traditional disk-based systems. When there is a need to failover a server to the MirrorCloud environment, the performance is equal to the production server.

Reliability

MirrorCloud's storage is based on a revolutionary "BitSpread" technology, a methodology that spreads information across multiple disks over multiple cloud servers. This advance recovery technology allows more drives to fail than a traditional RAID 5 configuration.

Affordability

MirrorCloud's modular approach allows you to add resources as needed. Pay for only what you need. The MirrorCloud technology platform enables deployment at minimal upfront costs reducing Capex expenditure.

Transitioning to Virtual Infrastructure

Transitioning clients from existing infrastructure is seamless with MirrorCloud. Once a physical machine is virtualized in a SmartStyle environment, it can run permanently in a virtual state.
